# Tips for ggplot2

Plot creation steps
1. Set the data
2. Map variables to aesthetics
3. Choose a shape layer
4. Add non-variable adjustments

Basic ggplot2 syntax
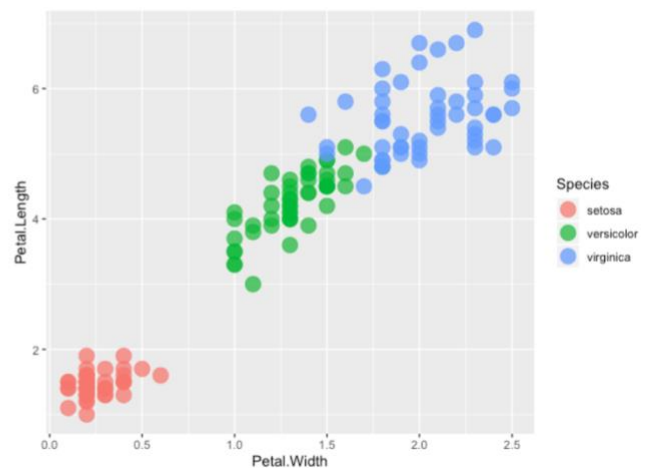

data and aesthetics will carry through from main function to shape layers

```
Main function    ggplot( data = data frame ,
                         mapping = aes(variable mappings) )                    +

Shape layer      geom_...( data = data frame ,
                           mapping = aes(variable mappings) ,                  +
                           non-variable adjustments )

Shape layer      geom_...( data = data frame ,
                           mapping = aes(variable mappings) ,
                           non-variable adjustments )
```

Example with code

Petal.Width	Petal.Length	Species
0.3	1.4	setosa
1.3	4.0	versicolor
2.1	5.7	virginica

```
ggplot(data=iris,
        aes(x=Petal.Width,
            y=Petal.Length,
            color=Species)) +
geom_point(size=5, alpha=.75)
```

Other useful layers

Code	Description
`geom_hline(), geom_vline()`	Horizontal and vertical lines on chart
`geom_smooth(method="lm", se=F)`	Linear trend line based on the data
`geom_text()`	Text labels for individual datapoints
`annotate()`	Extra text and shapes, not related to data
`coord_flip()`	flip whatever has been mapped to x and y axes
`facet_wrap(~a), facet_grid(a~b)`	split plot into small multiples; use "." for blank
`labs(title=…, x=…, y=…)`	Add chart and axis titles
`theme_…()`	Use and/or customize a different theme
`base_size=…`	Increase or decrease size of most text elements
`scale_[aes]_[transform](…)`	Manipulate specific aes mappings
`scale_x_continuous()`	Edit a numerical x axis
`scale_x_log10()`	Apply a log transform to x axis
`scale_x_discrete()`	Edit a discrete x axis
`scale_fill_manual()`	Edit categorical fill values manually
common options:	
`limits=c(…)`	change minimum and maximum limits
`breaks=c(…)`	change where axis/legend breaks are
`labels=c(…)`	change labels on axes/legends
`values=c(…)`	set values for manual discrete color scale
`name=""`	change label for axis/legend
